- Do you think we always need to use them? Explain.

Let's Explore!

Listen to the expert talking about Superglobals.

Instructions: Read the text below.

I could bet you wish programming language weren't so difficult. Decades ago, only a bunch of people had been capable of working in software, but all the progress we have had is making the software language and programming friendlier.

Let's talk about one of those huge progress tolls; that one is the introduction of Superglobals. They included them since PHP version 4.1.0. You can consider them as built-in variables. What every programmer loves about them is the fact that they are available and can be accessible from any function, class or even file without any effort! It saves time and energy.

The software developers had worked tirelessly and non-stop until Superglobals made it easier. There are a total of nine Superglobals, they are:

```
$GLOBALS
$_SERVER
$_REQUEST
$_POST
$_GET
$_FILES
$_ENV
$_COOKIE
$_SESSION
```

You wish you didn't have to study so many variables, right? Don't worry; we will just study some of them in this lesson.

Let's start with \$GLOBALS, they are used to access global variables from anywhere in the script! Pretty amazing, don't you think so? This is possible because PHP stores all the global variables in a special array or index. When you start to get familiarized with it, you will love it.

\$_SERVER is our second superglobal, it stores not variables but rather the information about headers, paths, and script locations.

\$_REQUEST, \$_POST, and \$_GET are all used to collect data after submitting the HTML form, they have some differences, and the uses differ according to your needs, but we will work on that later on, just remember what they do in general terms.

Let's finish today lesson with that. I know you are excited, and you wish we didn't have to wait until next week to continue on this topic, but for now, just study these Superglobals by your own.

Let's Practice!

Find the superglobals in PHP (\$_ has been omitted).

Instructions: Find the words in the wordsearch below.

1. GLOBALS
2. SERVER
3. REQUEST
4. POST
5. GET
6. FILES
7. ENV
8. COOKIE
9. SESSION

Let's Practice!

Defining Superglobals

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: had stored, had, had served, used.

1. Software developers _____ worked harder until Superglobals appeared.
2. Programmers had _____ PHP 4.0 until PHP 4.1.0 arrived introducing Superglobals.
3. Programmers _____ variables with a global scope, they kept using \$GLOBALS for this purpose.
4. Some other tools _____ the same purpose as Superglobals before, but Superglobals were better.

Learning Points

Past Perfect Tense

Past perfect is used for an action that happened before another.

When we talk about events in the past, some actions happened before than others, for those older sentences, we use **past perfect**.

Structure is as follows:

Subject + had + verb in past participle + complement.

Examples

When he arrived to the party, everyone else had left

(People left the place before he arrived) this action happened first or was older

When my mom called to ask for my brother, he had already fallen asleep

(He fall asleep before his mom called)

Examples

- *Only a bunch of people had been capable of working in software*
- *The software developers had worked tirelessly and non-stop until Superglobals made it easier.*

Wish + past form of verb for wishes – Negative Form

We use **wish + negative past form of verbs** to express that we would like for things to be different.

Wish + negative past form of verbs helps us to express that we don't like the way things are.

It follows this structure:

Subject + wish + subject + negative past form of verb + complement

Examples

I wish Jenny didn't work on Sundays.

I wish my job didn't make me get up so early in the morning.

She wishes her son weren't so sick

Examples

- *I could bet you wish programming language weren't so difficult.*
- *You wish you didn't have to study so many variables, right?*
