Let's Start!

Different Conditional Statements

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts.
Describe applications for an operating system for personal computers in a range of work contexts.

Can Do Statements:

- I can talk about the use of conditional statements in PHP.
- I can list the different types of conditional statements in PHP.
- I can use different types of conditional statements in PHP.

Ask your partner:

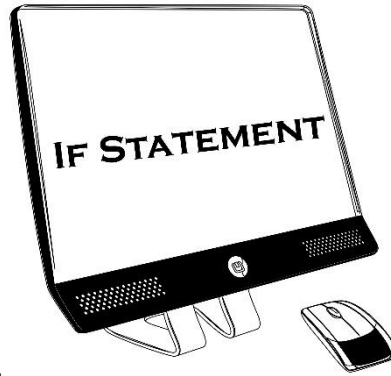

- Do you consider important that a program performs specific actions when you write a code? Why?
- Is it important that an expression evaluates to true or false the codes' statements? Why?

Let's Explore!

Sebastian is helping Gabriel to understand the conditional statements.

Instructions: Read the text below.

- Gabriel:** I wish the conditional statements were easier to comprehend.
- Sebastian:** They are not difficult at all!
- Gabriel:** Are you out of your mind? Of course, they are!
- Sebastian:** Let me help you, and you'll see that's not true.
- Gabriel:** Go ahead!
- Sebastian:** Remember that the conditional statements are used to perform specific actions depending on certain conditions.
- Gabriel:** I know that, but the different types of statements are what puzzle me.
- Sebastian:** I wish you said that before! I would have gone straight to the point. The first type, the if statement, is an action that the code executes if a condition is true. Let's use video games as an example; the condition is the hour, it is before 6pm, the character say "Hi", period.
- Gabriel:** Okay! I got that example, but what about the if...else statement?
- Sebastian:** That one executes a code when a condition is true, and the other one is false. Well, let's use the same example but with a different character. If you talk to it, it will say "Good morning" if it is before noon, and if it is after noon, it will say "Good afternoon".
- Gabriel:** Oh, I get it. Only one of the conditions can be true at the same time, right?
- Sebastian:** Exactly!
- Gabriel:** Now, create an example using the if...elseif...else statement, the bare name is confusing!
- Sebastian:** That one is used when there are more than two conditions. Picture the same example as before, but now, there is a third option. If it is after 6pm, the character will say "Good evening"
- Gabriel:** So, to sum up, these statements vary depending on the number of conditions.
- Sebastian:** Pretty much.
- Gabriel:** Well, I wish I weren't so slow
- Sebastian:** You're not. It's easier than you think.

Let's Practice!

Conditionals in PHP

Instructions: Proofread the sentences. Correct the mistakes.

Gabriel: I wish the conditional statements were not so difficult to comprehend.

Sebastian: They are easy than you think!

Gabriel: well, but I don't understand.

Sebastian: Basically, you push the conditional statements to perform different actions when you write a code.

Gabriel: You look so confident with this topic. I wish I will understand as fast as you do it.

Sebastian: No, I have some doubts yet. However, Carla Smith knows it perfectly. I really wish I were liked her.

Gabriel: Yes, she is a genius!

Let's Practice!

Types of Conditional Statements in PHP

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. If statement
2. If ... else statement
3. Ifswitch...statement
4. If statement ...else
5. Elseif...elseif statement
6. If...if...switchif
7. If... elseif... else statement
8. Switch statement

<i>Conditional Statement in PHP</i>	<i>Non- Conditional Statements in PHP</i>

Extension Activity

Let's review conditional statements!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about the four types of conditional statements.
- Make a chart in which you include the main information of each type.
- Share your chart with the rest of your class.

Self-Assessment

Yes

No

- I look for information about conditional statements.
- I make a chart with main information about conditional statements.
- I share my chart with the rest of the class.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **Go straight to the point** (idiom): to answer a question or explaining something directly
e.g. I wish you said that before! I would have gone straight to the point.
- **Puzzle** (verb): to make feel confused
e.g. I know that, but the different types of statements are what puzzle me.
- **Picture** (verb): To imagine
e.g. Picture the same example as before, but now, there is a third option, it is after 6pm, the character will say "Good evening"
- **Sum up** (verb): to conclude an idea
e.g. To sum up, these statements vary depending on the number of conditions.
- **Be out of your mind** (idiom): to be crazy
e.g. Are you out of your mind? Of course, they are!
- **Execute** (verb): to run
e.g. The first type, the if statement, is an action that the code executes if a condition is true.

Learning Points

Wish + past form of verb for wishes for present and future

We use **wish + past form of verbs** to express that we would like for things to be different.

Wish + past form of verbs helps us to express that we don't like the way things are.

It follows this structure:

Subject + **wish** + subject + **past form of verb** + complement

Examples

I **wish** I **understood** the conditional statements.

I **wish** my job **were** easier, but I work with conditionals in PHP.

She **wishes** her son **passed** the exam, but he.

Examples

- *I wish the conditional statements were easier to comprehend.*
- *I wish you said that before! I would have gone straight to the point.*
- *Oh. I wish I weren't so slow...*

Breaking down the if...elseif....else statement

The if...elseif....else statement can be a little confusing, so here are some examples for you.

Remember that the **if...elseif....else** statement is used when there are more than 3 conditions.

Examples 1:

Imagine you are playing a video game, you are asked to pick between 3 colors; red, blue and yellow.

The condition is that the AI of the game would never choose the same as you, it would choose the next option.

So, if you pick red, the AI would choose blue. If you pick blue, the AI picks yellow, and if you pick yellow, the AI picks red.

Example 2:

You are making a letter in Microsoft word, you are using the mouse, have you noticed that the mouse cursor changes?

If it is over text, it looks like a capital I.

If it is over an icon, it turns into an arrow.

If you put it between the pages borderline it becomes two arrows in two boxes.
