Let's Start!

Extension for PHP

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts.
Describe applications for an operating system for personal computers in a range of work contexts.

Ask your partner:

- Do you know how to create an extension? Explain it.
- What do you understand by case sensitivity?

Can Do Statements:

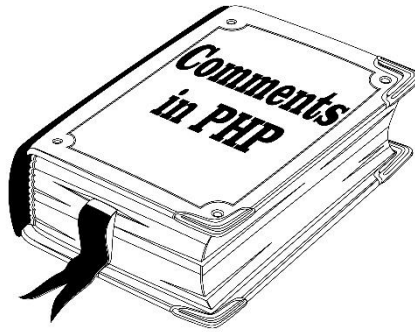

- I can talk about basic ideas on PHP syntax.
- I can discuss information about comments in PHP.
- I can talk about case sensitivity in PHP.

Let's Explore!

Mike is having problems with the PHP Syntax.

Instructions: Read the text below.

Sebastian: Mike, you got me in this PHP mess! Do something!

Mike: If you are having technical hitches with PHP, I'll be glad to help you.

Sebastian: I can't understand PHP syntax!

Mike: Well, let me ask you something, can PHP scripts be located anywhere in the document?

Sebastian: Yeah, they can. I'm having trouble with the extension and comment parts.

Mike: No problem. About the extension, remember that all the PHP files use ".php" as an extension; the scripts begin with "<?php" and can end with "?>:". In addition, keep in mind that a PHP file can contain HTML tags.

Sebastian: What about the comments?

Mike: Don't get tangled with comments. These are simply lines of text that you put in the script, but these are never read by the program. So, if you run the program, it will never be seen.

Sebastian: How can a line be written but not read? What is its purpose then?

Mike: As the name says, it's just a comment. Programmers put it to remind themselves of anything they did so that other developers can see their ideas, comments, or even suggestions about the script.

Sebastian: So, a comment in PHP is just a text that appears for developers.

Mike: Precisely. However, if you are having trouble with that, there will be a problem with the case sensitivity, too.

Sebastian: Well, I know that keywords like if, while, and echo are not case-sensitive in PHP, but WHILE or WhiLE are the same for PHP.

Mike: Oh! You could figure that out.

Sebastian: Hey, I'm not dumb! Just confirm me this: keywords are not case-sensitive, but how come variables cannot be written like keywords?

Mike: For PHP, \$Color, \$COLOR, and \$CoLoR are completely different statements because they store different information.

Sebastian: I thought you would need more help.

Mike: I thought it too, but if I need further information, I will let you know.

Let's Practice!

Can PHP syntax be used easily?

Instructions: Proofread the sentences. Correct the mistakes.

- Andrea:** Hey, let me ask you something, could PHP scripts be place anywhere in the document?
- Brian:** Yes, they can.
- Andrea:** How can a line been wrote but not read? What is its purpose then?
- Brian:** People put it so other developers can see their ideas, comments, or even suggestions about the script.
- Andrea:** Confirm me now this: keywords are not case-sensitive, but how come variables couldn't be written like keywords?
- Brian:** Because variables are completely different statements since they store different information.

Let's Practice!

If you need to know more about PHP, this will be useful for you!

Instructions: Match the sentences from Column A with Column B.

COLUMN A

1. If you are having technical hitches with PHP,
2. They are simply lines of text that you put in the script, but they are never read by the program, so if you run the program,
3. I thought I would need more help, but if I need further information,
4. If you are having trouble with comments,

COLUMN B

- a. it will never be seen.
- b. I'll be glad to help you.
- c. you will have it with the case sensitivity, too.
- d. I will let you know.

Extension Activity

Let's create a mind map to explain PHP syntax.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about the correct use of PHP syntax.
- Make a summary of the most important aspects when talking about PHP syntax.
- Organize the information in a mind map.
- Share your mind map with your class.

Self-Assessment

Yes

No

- I look for more information about the correct use of PHP syntax.
- I make a summary of the most important aspects when talking about PHP syntax.
- I create a mind map explaining PHP syntax.
- I share it with my class.

☐ ☐
☐ ☐

Target Words

- **figure out** (verb): to realize, to understand something
e.g. You could figure out PHP codes if you ask the teacher to explain to you.
- **extension** (noun): the letters that a file has at the end of the name; they go after a period
e.g. About the extension, remember that all the PHP files use ".php" as an extension; the scripts start with "<?php" and end with"?> :".
- **get tangled** (verb): to get confused
e.g. Don't get tangled with comments, they simply are lines of text that you put in the script.
- **remind** (verb): to help someone remember something
E.g. Programmers put it to remind themselves of anything they did.
- **technical hitch** (noun): a problem related to the use of technology
e.g. If you are having technical hitches with PHP, I'll be glad to help you.
- **suggestion** (noun): a piece of advice or idea you give to another person
e.g. Other developers can see their ideas, comments, or even suggestions about the script.

Learning Points

Real Conditional Sentences with If Clauses

When we talk about possible actions in the future that depends on certain conditions, we use the **first conditional**.

We use the **first conditional** to talk about possible or real events in the future if the conditions are met.

Look at the following structure:

If + present simple tense + comma (,) + future tense (will)

Examples:

If you **know** how to properly manage PHP syntax, you **will be** able to create great designs.

You **won't have** good results with case sensibility **if** PHP **doesn't work** correctly.

Examples

- *If you are having technical hitches with PHP, I'll be glad to help you.*
- *They are never read by the program, so if you run the program, it will never be seen.*
- *If you are having trouble with that, you will have it with the case sensitivity, too.*

Passive of Modal Verbs: Can

We use the **passive voice** when we want to emphasize in the object and not in the subject that does it. Passive voice can be used anytime; we are going to focus on **can** and how to use it in questions.

Can is used to express possibility, permission or ability. In this case, you use **can** in questions to ask for an object's function.

To use **can** in yes / no questions, we use the following structure:

Can + object + **be** + **verb in past participle** + complement?

Examples:

Can this document **be modified** by using PHP?

Can a line **be executed** in PHP?

In case, you want to use **can** with wh-questions, follow this structure:

Wh-word (what, where, when...) + **can** + object + **be** + **verb in past participle** + complement?

Examples:

Where **can** PHP syntax **be used**?

How **can** a PHP code **be modified**?

Examples

- *Can PHP scripts be placed anywhere in the document?*
- *How can a line be written but not read? What is its purpose then?*
