Let's Start!

Importance of Basic Strings

Learning Outcome:

Understand information about web applications, their principles and basic concepts in a range of work contexts.

Describe applications for an operating system for personal computers in a range of work contexts.

Ask your partner:

- Do you consider it's important to know how to replace texts in PHP? Why?
- What ways do you know to search for specific texts in PHP? Explain.

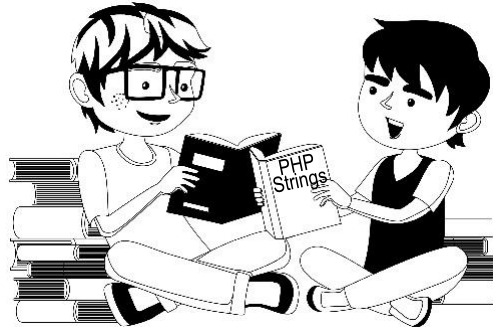

Can Do Statements:

- I can say what a string in PHP is.
- I can list some commonly used functions to manipulate strings.
- I can talk about characteristics of some commonly used functions to manipulate strings.

Let's Explore!

Mike and Luke are studying and reviewing the Basic Strings in PHP

Instructions: Read the text below.

Mike: Luke, what's a string in PHP?

Luke: Basically, it's a type of PHP data considered as a sequence of 256 characters.

Mike: We can study together so that we will know what to answer in the exam.

Luke: Well, I've decided not to study that anymore because I simply don't understand.

Mike: But, the test is tomorrow. I swear you still miss studying all the functions to manipulate strings.

Luke: I wonder how to study that. There are too many!

Mike: Well, let's review some of them, and call it a day.

Luke: It sounds good!

Mike: So, tell me where to put the functions and the strings in PHP.

Luke: The string, which is a sequence of characters, goes in parenthesis, while the function has to go before the parenthesis. For instance, `soundex( )` would be a good sample of it.

Mike: Now, tell me, what functions can you remember?

Luke: To start, there is a function that calculates the length of a string; I mean, it tells you the number of characters of that string. Then, another function counts the words in a string. Next, there is another one which is good for searching for specific texts within a string. In fact, the function that I prefer the most is `strev()` because it reverses a string. For example, if you write "Mop" and use this function, it will reverse it into "Pom".

Mike: So interesting!

Luke: Yes. To continue, other functions can manipulate strings, so it allows you to replace text or characters; another one splits them into arrays, changes the letters to lowercase. Finally, there is a function that can randomly shuffle all the characters in a string, while others compare two strings.

Mike: Wow, it's difficult not to get confused with all that information. Remember not to strain yourself so hard about this. The teacher would not expect you to know all the functions.

Luke: I hope you are right about this.

Mike: I'm sure!

Let's Practice!

Useful Functions

Instructions: Write the words to correctly complete the sentences. Use words from the box below.

Remember not / be careful / to search / not to write / sure not to

1. _____ to use `str_word_count ()` to get the length of a string. Instead use `strlen ()`.
2. To count the number of a string, use `str_word_count()`. Make _____ use any other function for this.
3. To reverse a string, _____ not to use PHP `strpos()`, the one you need is `strrev()`.
4. Remember not to use `strrev ()` _____ for a specific text within a sting, you must use `strpos ()`.
5. To replace a text within a string, make sure _____ the `strpos ()` function. Please, use `str_replace()`.

Let's Practice!

Defining Strings

Instructions: Select the correct answer.

1. **A:** I need to know _____ use if I want to get the length of a string.
B: I remember I could use the function `strlen()`.
 - what to • where to • how do
2. **A:** I don't understand _____ count the number of words in a string.
B: I think I should use `str_word_count ()`.
 - when to • how to • where to
3. **A:** Let me know _____ write the function `strrev ()` to reverse a string.
B: You can write the code at the end of the character.
 - what to • where to • how do
4. **A:** I don't know _____ type in to search for a specific text within a string.
B: You should use `strpos ()`.
 - what to • where to • when to
5. **A:** Tell me _____ replace text within a string, please.
B: I think I need to use `str_replace()`.
 - where to • how to • what does

Extension Activity

Talking about Strings in PHP

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about string functions in PHP.
- Create a chart where you include the function and its use.
- Prepare a presentation in which you explain what to do and what not to do with each function.
- Share your work with the class.

Self-Assessment

Yes

No

- I understand what a String in PHP is.
- I identify functions to manipulate strings in PHP.
- I talk about functions and their usage for strings in PHP.
- I share my work with the class.

☐ ☐
☐ ☐
☐ ☐
☐ ☐

Target Words

- reverse** (verb): to make something the other way around
e.g. If you write "Mop" and use this function, it will reverse it into "Pom".
- lowercase** (noun): the writing of letters that does not contain capitalization
e.g. Another one splits them into arrays, changes the letters to lowercase.
- shuffle** (verb): to re-organize randomly something
e.g. Finally, there is a function that can randomly shuffle all the characters in a string, while others compare two strings.
- swear** (verb): to promise something that could be true
e.g. I swear you still miss studying all the functions to manipulate strings.
- Call it a day** (idiom): to finish the work for today
e.g. Well, let's review some of them, and call it a day.
- length** (noun): duration or extension of something
e.g. There is a function that calculates the length of a string, I mean, it tells you the number of characters of that string.

Learning Points

Position of not with to + verb

You use the particle **Not** when you want to talk about a negative situation or event.

When you have an infinitive form, the particle **Not** usually goes just before the preposition **to**.

Look at the following structure:

Statement + **not** + verb in infinitive form (to + verb)

Examples:

*Remember **not to** use the string variable without the correct codes.
It's important **not to** confuse string variables with PHP operators.*

Examples

- *II've decided not to study that anymore because I simply don't understand.*
- *It's difficult not to get confused with all that information.*

Questions Within Sentences: How to / Where to / What to

You use question within sentences when you need to ask about certain information of a place, a process, or the way to do something.

To make these indirect questions in a negative or affirmative sentence, follow this structure:

Sentence + **how to / what to / where to** + verb in infinitive form+ complement

In this case, we included some WH question words, followed by the preposition **to**, such as **how to**, **where to**, and **what to**. Remember that the use of the wh-words depends on what you want to know.

Examples

*I need to ask **how to** reverse a string.*

*Let me know **where to** to go.*

*I don't know **what to** do about exam of arithmetical operators.*

Examples

- *So, tell me where to put the functions and the strings in PHP.*
- *I wonder how to study that. There are too many!*
- *We can study together so that we will know what to answer in the exam.*
